Abstract (en)

[origin: EP1083139A2] The web winding device has a support roller (7) which can be moved so that rests against the winding roller (5). The support roller is divided into sections (7a - 7h). These can be driven by a friction roller (14) which acts as a common drive. Each section is mounted on two arms (8) and can be uncoupled from the drive by pivoting it so that it rests against a frame (9).
