Abstract (en)

[origin: EP1083283A1] The arrangement has individual two-latch locks and an associated central locking system. The locks each contain a locking element with defined unlocking, pilot latching and main latching positions. At least one lock (12) has a first sensor for detecting the pilot latching position, a second sensor (13) for detecting a manually applied force for opening the associated cover or door and a control unit (10) that only triggers movement of the locking element into the unlocking position if the pilot latching position and a manual opening force are both detected.
