Abstract (en)

[origin: EP1083284A1] The arrangement has a door handle bearing in two parts (10a, 10b), a pivotable, adjustable handle (6) that can be pivoted from a rest position into an actuating position and a switch (11) on the handle or bearing for detecting operation of the handle from its rest position. Movement of the handle causes displacement of an outer actuating lever (12) in a lock mechanism or an electric function to open the door. The movement of the outer handle is transferred to the outer actuating lever or opening switch with a delay.
