Abstract (en)

A directional boring bit assembly of the invention includes a headpiece (12) having a rear portion configured for attachment to and removal from a front end of a generally cylindrical drill head section (15). The headpiece (12) preferably has a passage therethrough for conveying fluid therein from the drill head section (15) to a fluid ejection port on the headpiece, and a forwardly opening lengthwise socket (30). A bit (14) having a front portion configured for directional boring and a rear portion configured for sliding insertion into the socket (30) is held in the socket by a manually removable retainer such as a roll pin. The roll pin secures the bit (14) in the socket so that sliding movement of the rear portion of the bit (14) out of the socket (30) is prevented during directional boring with the bit assembly. The directional boring bit assembly of the invention provides interchangeability of bit styles in combination with a more secure system for mounting the bit. <IMAGE>
