Abstract (en)  
[origin: EP1083388A1] Two long telescopic sections (2, 8) can be turned through a limited angle of rotation (  $\beta$  ) relative to one another, around their common longitudinal axis. This takes them from an axially-locked orientation, to a released, axially-free orientation. The pair can be at least locked against axial motion, and can also be locked in relative rotation with each other. By turning back in the opposite direction they are released again.
