Abstract (en)  
An electrical switch (30) includes an insulative substrate (32) having a top surface (36). Switch circuitry (34,34a) is disposed on the insulative substrate and includes a first conductive contact (34) on the top surface of the substrate. A flexible, insulative top layer (40) is disposed directly on top of the substrate (32). The top layer includes an actuator portion (42) having a second conductive contact (44) on the bottom thereof in registry with the first conductive contact (34). A step (46) in the top layer (40) is formed about the actuator portion (42) to elevate the actuator portion and space the second conductive contact (44) from the first conductive contact (34). Depression of the actuator portion (42) toward the substrate (32) moves the spaced second conductive contact into engagement with the first conductive contact. <IMAGE>
