Abstract (en)

[origin: WO9963864A1] A partitioning device for partitioning shop shelves and storage shelves that are provided with at least one mounting strip (2) which extends along one longitudinal edge of the shelf (1). The partitioning device (3) includes at one end at least one plastic gripping means (5) which includes two gripping claws (6) intended for coaction with the mounting strip, said gripping claws being separated by a slot-like opening (7). The mounting strip (2) and/or at least one of the gripping claws (6) is provided with a friction enhancing elastomeric material (8; 11) for coaction with at least one gripping claw (6) or with the mounting strip (2) such as to prevent or to impede unintentional displacement of the partitioning device (3) along the strip, even when using a relatively low contact pressure between the claws and the strip. This eliminates or reduces the risk of cold flow of the plastic material in the gripping part (5, 6).
