Abstract (en)  
[origin: WO0048671A1] The present invention relates to a device for the biological activation of water, soils, plants, agriculture seeds and other biogenic objects using natural materials. This activator includes a set of activation members having different shapes and colours. Each activation member consists of pontian limestone and is made in the form of a body defined by two parallel straight lines that form a plane which is inclined at an angle of 90 DEG relative to the apparent line of the mineral geological horizon. The activation members are rigidly attached on a base made of a metal-free material. The thickness of each of the activation members may be different and is at least of 3 mm. The ratio between the total surface area of the activation members and the surface area of the base is 0.75-1.0. The activation members attached to the base are arranged in a transparent housing. This activator has a high-level activation action on water, soils, plants and other objects.
