Abstract (en)

[origin: EP1085284A2] This invention concerns a structure for heating appliances with fluid circulation, such as radiators and/or towel warmers. It consists of a number of radiator bodies made of tubes or columns (13) connected to end heads (12). Each head (12) consists of head modules (14) joined in line, with two or more connecting branches (17) for fastening to the tubes or columns (13). Each head module (14) consists of two complementary and facing elements, which are fixed together longitudinally along the facing parts, each one having at least one perforated branch (17) that communicates with said collector-hole and with the tube fixed to the branch itself. <IMAGE>
