Abstract (en)  
[origin: WO9961210A1] A device that can be used to cut hair, comprising a support with a grip section and, on the front part of the support, opposite the grip section, at least one blade that is directed in a perpendicular position with respect to the longitudinal extension of said support. At least one protuberance (15) is provided next to the blade (12). Hair can be trimmed both selectively and specifically with the aid of said device which can be guided by the protuberance along the head. Preferably, the device is configured as a pair of scissors to cut hair, comprising two cutting blades (1, 2) that are hingedly connected to each other. On the front ends of one cutting blade (1,2) or both cutting blades (1,2) and located opposite the grip rings are blades (12) with cutting edges that are directed perpendicular to the longitudinal extension of said cutting blades (1,2). Protuberances are provided close to the blades (12) to enable the scissors to be guided along the scalp.
