Abstract (en)

[origin: DE19916528A1] The invention relates to an electronically controlled electric motor comprising coils (5) which are arranged in a stator (2), are located opposite permanent magnets (4) of a rotor (3) and which serve as position sensors (6). Said coils (5) are manufactured as one piece with connecting lines (7). As a result, the electric motor can be used in an environment containing solvents. In addition, production of the electric motor is particularly cost-efficient.
