Abstract (en)

[origin: WO9966654A1] The invention relates to a method and device for transmitting information at various carrier frequencies by means of sudden frequency change. A random sequence of a number of N possible carrier frequencies f_x is generated in addresses 1-N of a table (25) in a device (20). At least one part M of the N carrier frequency values f_x is read sequentially from the corresponding addresses of the table, whereby said operation is periodically repeated and $M \leq N$. Subsequently, information is transmitted in a device (4) at the corresponding carrier frequencies. The method and device can, for instance, be used in a mobile station or base station belonging to a mobile radio telephone system.
