Abstract (en)
[origin: EP1088626A2] The method involves using an operation tool with at least one opening perpendicular to the screw axis to positively fit a securing unit. The nut or screw is moved about and along the screw axis by the tool. The opening in the screw and nut connection is detected by a sensor. The screw and nut connection is secured in an aligned self-locking position. The securing unit is positively fitted into the opening, to lock the screw and nut connection. An Independent claim is included for a device for implementing the method.
