Abstract (en)  
[origin: DE19827635A1] The assembly to lay a number of continuous yarns simultaneously at the bobbin sleeves, held in a bobbin winder, has a carrier arm (1e) where the yarn guides (2a-2p) for each yarn slide along it. The carrier arm (1e) has at least one system to slide the yarn guides (2a-2p) parallel to the bobbin holder, and to position them at defined intervals. At least one sliding mechanism has a guide rod (5,6) where the yarn guides (2a-2p) slide along it. At least one sliding mechanism has draw rods to position neighboring yarn guides (2a-2p) at intervals between a min. and a max. value. The draw rods have carriers and/or positioning units in both directions of yarn guide movement along the guide rods (5,6). One of the two outer yarn guides (2h,2i) at the guide rods (5,6) is locked to the guide rod, while the outer yarn guides (2a,2p) at the opposite ends of the guide rods (5,6) are moved along the rods by the sliding mechanism. The sliding mechanism is a double-action piston/cylinder unit, with two units at the carrier arm (1e) in a mirror image array. One of the sliding mechanisms forms a component unit with the fixed yarn guides (2h,2i) at the guide rods (5,6). The yarn guides have a holder opening to lay the yarns.
