Abstract (en)

[origin: WO9966541A2] A method for maximising critical current density (J_c) of high temperature superconducting cuprate materials (HTSC) which comprises controlling the doping state or hole concentration of the materials to be higher than the doping state or hole concentration of the material that provides a maximum superconducting transition temperature (T_c), and to lie at about a value where the normal-state pseudogap reduces to a minimum. J_c is maximised at hole concentration p APPROX 0.19. HTSC compounds are also claimed.
