Abstract (en)

[origin: DE19919029A1] The invention relates to a device (10) for centering pharmaceutical containers, in particular, for centering head sections (1) of ampoules (2) in a filling unit. Said device has two centering elements (25, 35) with first and second receiving elements (27, 37). The centering elements (25, 35) can be driven in a transverse direction to the direction of transport (23) of the ampoules (2) and cooperate with a fixed counter support (16). As a result of the configuration of the centering elements (25, 35) and the counter support (16), the head sections (1) of the ampoules (2) are pushed by the first centering element (25) into the receiving elements (37) of the second centering element (35) in a tight-fitting manner.
