Abstract (en)
A gear driven rotary apparatus for processing a continuous flow of web-product comprising a lower cylinder (32) positioned beneath said web-product and an upper cylinder (34) positioned above said web-product. Both the lower and upper cylinders are supported by eccentric cylinder mounts (38) that permit the cylinders to be moved between an engaged position against surface of the web-product and a disengaged position spaced away from the web-product. A cylinder drive assembly having one or more gears (60, 62, 64, 66, 68) connects each of the cylinders to a common drive pinion gear (70) in such a manner that the cylinders remain connected to the drive pinion when the cylinders are moved between the engaged and the disengaged positions. <IMAGE>
