Abstract (en)
A pull-up louvered shutter comprising a predetermined number of solid slats adapted to be lowered or raised along substantially parallel rails provided on both sides of a window or door opening, said slats slidably attached at their ends to said rails, wherein said slats are aligned in parallel, connected to a collapsible suspending means suspended over said opening, whereby when said suspending means is in its slack state, said slats may be reoriented between a first horizontal overlapping orientation and a second vertical upright orientation by tilting means, and wherein said slats, when oriented in said first horizontal overlapping orientation may be raised and lowered along said rails. <IMAGE>
