Abstract (en)

[origin: EP1094179A1] The key contains electronic coding data which is compared to stored data to allow or block release. If satisfied, the key turns a cam (16) anticlockwise to position a magnet (168) adjacent another (188) on a spring (186) biased lever (18) turning it to unblock the manual release cam (20). The manually operated cam (20) is turned clockwise to reset the key cam by means of a pivoted (224) lever (22) and a wire (204) releases the lock catch.
