Abstract (en)

[origin: US6517042B1] The invention relates to a stand for vertically receiving rod-shaped materials, comprising a base plate (1) that has two diametrically opposite clamping jaws (2) which are disposed on a substantially horizontal plane and are used for receiving a rod. At least one (2.2) of said jaws can be displaced radially in an outward direction counter to the force of a spring (5). Said displaceable clamping jaw (2.2) is pivotally connected to one end of a lever (6), whereby the opposite end thereof is guided and displaced in a substantially vertical manner and is located above the horizontal plane defined by the direction of movement of the clamping jaw (2.2).
