Abstract (en)

[origin: FR2781006A1] The invention concerns a device comprising a rail (1) guiding a window (3) support slider (2) and means for fixing said slider (2) on said window (3); said means comprise a pin (4) pre-mounted in an opening (5) of a branch (2b) of the slider (2), opposite a corresponding passage hole (6) in the window, and a screw (7) pre-assembled to the second branch (2a) of the slider (2) on the side opposite the pin (4) and opposite the window hole (6); when the screw (7) is screwed into the slider (2) and through the window hole (6), then in an axial channel (12) of the pin (4), it exerts thereon a traction which causes it to slide inside the slider hole (5) and the window hole (6) until it is urged to stop against the slider branch (2a). This assembly is extremely simple and ensures more dependable mounting than known devices. The user operating it senses when the assembling is completed by the increase in the screw (7) torque; moreover, if the pin (4) is forgotten, the screw slips thereby warning the operator about the absence of the pin (4).
