Abstract (en)
[origin: WO0003845A2] According to the invention, two housings (5) which are guided in the X and Y axes and designed for receiving workpieces (6) can be displaced independently of each other and according to an alternating, cyclic sequence of movements in a shared working plane between an input station (7), a machining station (8) and an output station (9). Drive and guiding means (2, 3, 4) for the two housings (5) are positioned on both sides of the working plane. This makes it possible for the workpieces (6) to be machined almost continuously.
