Abstract (en)  
[origin: WO0004621A1] It consists of a system aiming at creating high frequency networks, which can be transformed into direct current through converters to power engines, special engines for refrigerators and household appliances, equipment, light bulbs, and others which can use this type of network, with the advantage of reducing their size, where such system is divided into four essential parts, the high frequency source, the AF distribution network, the igniting circuits, and the special charges, being possible to control the power factor.
