Abstract (en)

[origin: EP1098027A2] A hinge device (1), particularly for the door (3) of an electric household appliance (2), of the type washing machine, oven and the like, includes a connection element (10) connected to the frame (6) of the appliance (2), a support element (30) to which is connected the door (3) and a shaped element (20), whose first end (21) is hinged to the connection element (10), and whose second end (23) is hinged to the support element (30). The device further includes stop means, first (14) and second (34) fit to limit the amplitude of the rotations, respectively first (R1), between the shaped element (20) and the connection element (10), and second (R2), between the support element (30) and the shaped element (20), and friction means (32), positioned between the shaped element (20) and the support element (30). The friction means (32) are fit to differentiate the values of the counter actions exerting against the rotations, first (R1) and second (R2), determining a two-stage opening-closing for the door (3), so that this latter changes from a closing condition (C), in which the door (3) closes the load opening (5) of the appliance (2), to an extreme opening condition (A), in which the same door (3) is at the maximum distance from the opening (5), through an intermediate opening condition (B) in correspondence of which there is the passage between the conditions of rotations, first (R1) and second (R2). <IMAGE> <IMAGE> <IMAGE>
