Abstract (en)

[origin: EP1098118A2] A cylindrically curved rectangular face seal (10) is provided for a cross-ported barrel type rotary valve member (38). The seal has a central flow orifice therethrough with an annular raised rib formed about the orifice and extending in a radial direction from the concave inner face of the seal. The opposite edges of the seal extending in an axial direction each have a notch or rib (20,24) thereon for axial sliding engagement in grooves provided in the valve body. The annular rib about the orifice accommodates dimensional variation in the valve parts to ensure a rotary sliding seal on the rotary valve member. <IMAGE>
