Abstract (en)  
The method involves applying voltage pulses to the component terminals. The electrical field produced by this generates mechanical stresses in the domain walls of the component which, with faulty components, leads to crack formation. This in turn produces an acoustically measurable noise which can be picked up by a microphone and evaluated by comparing the resultant frequency spectrum with that for high quality components

Abstract (de)  
Die Erfindung betrifft eine Vorrichtung und ein Verfahren zur zerstörungsfreien Prüfung von passiven Bauelementen (1), bei denen zur Qualitätskontrolle von passiven Bauelementen (1) ein elektrisches Prüfsignal auf das Bauelement (1) angewendet wird und eine akustische Emission mittels eines Mikrofons (4) meßbar ist, welches einer Auswerteeinheit (5) zugeführt wird. <IMAGE>
