Abstract (en)
[origin: WO0004903A1] A method of inhibiting HIV-1 infection is provided that comprises administering to a subject an effective amount of an active compound having a molecular weight of between 200 daltons and 650 daltons. At a concentration of not more than 100 μ M, compounds useful in the practice of the invention inhibit greater than 50 % of the binding of gp120 to CD4. Preferred compounds are further characterized in that they inhibit less than 10 % of the binding of human CD4-expressing, CD4-transfected COS cells to Raji cells.
