Abstract (en)
[origin: WO0006688A1] The invention relates to a composition for use in a dishwashing machine, characterized in that it consists of a base composition which becomes active substantially during the main wash cycle of the dishwashing machine; at least one particle having at least one core which contains at least one substance which becomes active substantially during the rinse cycle of the dishwashing machine; and a coating which substantially fully encloses the core(s) and contains at least one compound whose solubility increases as the concentration of a specific compound in the surrounding medium decreases. The invention provides for means to prevent a significant dissolution of the coating or a significant detachment of the coating from the core(s) until the start of the rinse cycle. The invention also relates to methods for running the dishwashing cycle in a dishwashing machine using the composition provided for by the invention.
