Abstract (en)
A chair (1) comprises a leg frame, a back support (3) and a seat (5). The leg frame consists of two separate halves. A part of each one of these halves extends in beneath the seat (5) from each side of it and is secured in a body portion of the seat (5) by means of snap- or insert connections. The parts which extend in beneath the seat (5) are advantageously accommodated in undercut recesses (17, 18, 19) which are disposed on the underside of the seat (5). Further, these parts have at least one manifest curve (13, 14) each and they lie substantially in one and the same plane. The back support (3) has downwardly open accommodation spaces (30) for accommodating two uprights (8) which extend upwards from each respective half of the leg frame. <IMAGE>
