Abstract (en)
Press plates (4) and slip sheets (5) are alternately stacked in a storage part (30). A slip sheet pad unit is provided with a double sheet taking prevention mechanism comprising a suction cup (231) and a contact plate (264). When the slip sheet pad unit lowers, the contact plate comes into contact with the slip sheet in advance of the suction cup, and separates part of the slip sheet from the press plate while rotating. Then, the suction cup is pressed against this separated part. The suction cup sucks/fixes the slip sheet previously separated from the press plate and hence will not simultaneously suck the press plate under the same. <IMAGE>
