Abstract (en)
[origin: DE19925984A1] A fuel injection valve (100), especially an injection valve for fuel injection systems of internal combustion engines, has a valve-closing body (7) which is activated by means of a valve needle (5). Said valve-closing body interacts with a valve seat surface (6) provided on a valve seat support (1), to form a tight seat. The inventive fuel injection valve also has a valve housing (20), which partially encompasses the valve seat support (1) and which is connected thereto by a bordered connection. The valve seat support (1) is bordered to the valve housing (20) with an axial distortion.
