Abstract (en)
[origin: WO0072640A1] An electronic ballast for a low-pressure discharge lamp (LA) contains an inverter, which is supplied with direct voltage (UBUS) and whose output is connected to a load circuit containing connecting contacts for the lamp (LA). Said ballast also contains a filament transformer, which has a primary winding (Tp) that is connected to the output of the inverter, and a secondary winding (Ts1, Ts2) for heating each of two electrodes of the lamp (LA) respectively, said secondary winding being located in a heating circuit with a filament (W1, W2). Finally, the ballast has a series circuit that lies parallel to the load circuit. Said series circuit contains the primary winding (Tp) of the filament transformer and an electronic switching device (S3, S4). The currents are measured and evaluated in one of the two heating circuits and in the primary winding (Tp) of the filament transformer in order to determine the lamp type and the lamp mode.
