Abstract (en)

A rolling head (11) with dynamic balancing includes an internal body (12, 16) that supports within an external rotating body (22a, 22b). Rods (30) are articulated to the external body (22a, 22b) each bearing a pressure roller (36) and to which a drive component (54) is also connected for its rotary operation. The external body (22a, 22b) also bears some support parts (64) which are rotationally integral with it, to which at least one lever (74) is fixed around a fulcrum at each rod (30). Such levers (74) have one end positioned against the rods (30) and its opposite end hinged to sockets (60) which push a series of elastic parts (66) against the rod (30). The sockets (60) are articulated to the rolling head (11) so that each is able to move towards or away from the external body (22a, 22b). <IMAGE>
