Abstract (en)

[origin: EP1104221A2] Loudspeakers in general, and including those used in audio equipment e.g. for application in motor vehicles, suffer from the shortcoming of not being able to intrinsically vary their acoustic radiation characteristic, and any change obtained is at the cost of changing the position of the loudspeaker, or incorporating some sort of aid, such as acoustic reflectors, a signal summation stage etc. To change the loudspeaker acoustic emission characteristic more easily, the acoustic radiation characteristic of two loudspeakers (1,2) is made dependent of the evaluation (weighting) of the input signals (E1,E2).
