Abstract (en)
[origin: US6453580B1] A cross-country ski boot having a collar that is pivotally mounted by journals on an upper, and a device for retaining the collar that is active from a angular position and only in the front-to-rear direction by means of a fixed abutment located on the upper. The retaining device, located in the rear portion of the boot, includes a support mechanism that can be adjusted between two different positions with respect to the fixed abutment, one of the positions placing the support mechanism in cooperation with the latter and the other retracting it from the latter. The invention makes it possible to adapt a single type of cross-country ski boot for two different techniques such as the alternating step and the skating step.
