Abstract (en)
[origin: WO0009299A1] A cartridge (200) is formed with a pair of snap action connection features (216) on lower a surface of a platform portion (202) of the cartridge. Each of the snap action features has a barb-like connection portion (218) which is oriented toward the other, and are each separated by an essentially flat surface portion which extends from one of the snap action features (216) to the other across the lower surface of the platform. The handle is formed with angled projections (101) at the end of a connection head which engage connection portions (218) and deflect the snap action features (216) as they pass thereby and subsequently enter openings (220) formed in the platform portion (202).
