Abstract (en)  
[origin: WO0009902A1] A friction material supporting assembly (10) comprises a support (16), and friction material (24) rigidly supported thereon. The support (16) defines two sockets (26) which have openings (28) facing in opposite directions. The sockets (26) communicate with one another by means of a passage (32) through the support (16). The friction material (24) comprises two blocks (25), one of which is mounted in each of said sockets (26) so that it projects through the opening (28) thereof. The sockets (26) have side surfaces (26a) which are in contact with the friction material (24) so that braking forces can be transmitted to said support (16). The blocks (25) of friction material contact one another through said passage (32) and are secured together. A method of manufacturing the assembly is also claimed.
