Abstract (en)
[origin: WO0010479A1] Mixing and application capsule for dental materials having a container (10), a tubular piston (20) provided with a stamp (40) as a liquid container, whereby tubular piston (20) is held via a recess (26) during activation in an appropriately configured projection (18) of container (10) opposite the hand force displacing stamp (40), and a slider (32), which is joined with a discharge cannula (30), is hereby characterized in that container (10) has a guide groove (15) above passage borehole (13), in which slider (32) that can be moved by hand force is held, which tightly seals the capsule in the rest state, and, after the components have been mixed, releases the dental material in the conducting position via the connected discharge cannula (30).
