Abstract (en)

[origin: WO0011037A1] The invention describes three monoclonal IgG antibodies, referred to as SWLA1, SWLA2, and SWLA3, which appear to recognize a species-specific lipooligosaccharide or lipopolysaccharide on the cell surface of *S.mutans*. The invention also describes a rapid method of detection of *S.mutans* without the need for prior growth of the bacteria in culture. The invention further describes method of utilizing these antibodies for rapidly quantitatively detecting *S.mutans*. These methods are sensitive enough to detect the presence of a single *S.mutans* bacterial cell. These methods can be widely used in the clinical diagnosis and treatment of dental caries in humans.
