Abstract (en)

[origin: DE19837641A1] The method involves supporting the signalling protocol (CCSN7) for an interworking with a subscriber data base (HLR) of a mobile radio network (PLMN) by a network unit (GAW,GAK) of the packet switched communication network (IPN). A request is made from the network unit from the packet switched network to the subscriber data base of the mobile radio networks using the signalling protocol, if the routing of the connection is carried out in the packet switched network or in the mobile radio network. Preferably, a response is sent from the subscriber data base by sending back at least one information to the packet switched communication network with which the communication unit decides that the routing is carried out in the packet switched network.
