Abstract (en)

[origin: EP1106351A2] The arrangement has a controller that feeds a drive signal to a control element (91-93) to achieve a predefined position depending on the current position of the control element. After detecting a fault by the control unit, the current control element position is set manually, whereby the manually set position of the control element is treated as equal to the position defined by the control unit for further printing.
