Abstract (en)

[origin: EP1106748A2] The invention described is a supporting and holding device for positioning formworks comprising a first element (2) constituted of a tubular portion designed to come into contact with a peg (10) and a support element (3) fastened to the first element (2) and constituted of an angular portion composed of a pair of flat elements (3a) and (3b) positioned at right angles to each other and fastened together at the contact angle and envisaged to bear and hold a board (5). The device also comprises one or more bits present for plumblining a support structure. The device is designed to be set from a resting position, in which the first element (2) is not fastened to the said peg (10), the support element (3) is not holding a board (5) and the bits are not being used keep apart a support structure, to an operative position, in which the first element (2) is slid onto a peg (10) planted in the ground and on the support element (3) there is a board and the bits keep the support structure perfectly vertical. <IMAGE>
