Abstract (en)  
[origin: EP1108851A2] The clamp comprises a basis body (1) with a cord guide surface containing a round concave cavity, a trailing edge (25) and a first clamping surface (26). A clamping part (2) opposite the concave cavity can pivot about an axis (15) parallel to the trailing edge and is provided with a second clamping surface having two clamping sections. In the blocking position, the first clamping section lies directly adjacent to the cavity and the second clamping section lies directly adjacent to the first clamping surface, so that the cord (20) is fixed between the clamping part and basis body. In the released position, the second clamping surface is at a distance from the cavity, trailing edge and first clamping surface.
