Abstract (en)  
[origin: WO0013644A1] The invention relates to a urination device, especially for incontinent or bedridden persons, comprising a receptacle that has an inflow connector and an outflow connector, whereby a flexible tube is secured to the outflow connector and runs into a collector. The invention is characterised in that the receptacle (1) is configured as a cylindrical hollow body (2) with two front walls (6, 7) that are perpendicular to a longitudinal extension and whose overall dimensions are relatively small. The inflow connector (3, 13) is arranged eccentrically in an offset position, tending upwards. The length of the inflow connector corresponds to at most 1/3 of the body and the inclination thereof is approximately 110 DEG in relation to the front wall (6). Said inflow connector protrudes above the upper edge of the body (2) in a slightly radial manner only. A urine bag (20) known per se can be used as a collector. Said urine bag can be easily changed and is secured to the outflow connector (4) of the receptacle (1) via a flexible inflow tube (22).
