Abstract (en)

[origin: WO0016450A1] The invention concerns an electrical outlet for electrical connectors having two parallel pins of circular cross-sectional shape, comprising a plurality of holes (2a - 2d), behind which voltage supply means are disposed, said holes being paired to form pairs of holes, into the holes of which an electrical connector is receivable in order to be supplied with a certain predetermined voltage by said voltage supply means. A first hole (2b) associated with one of the pairs of holes and a second hole (2c) associated with the second pair of said pairs of holes are spaced apart the same distance as the two holes (2a, 2b and 2c and 2d, respectively) of a pair of holes, such that one of the pins of the electrical connector is receivable in said first hole while at the same time the other pin of said electrical connector is receivable in said second hole to be supplied with the predetermined voltage also in this position.
