Abstract (en)

[origin: US6390574B2] A fully extendible drawer unit utilizes two pairs of, in each case, three rails which can be pushed into one another. On the carcass rail is positioned a differential roller, which allows the intermediate rail to be moved along when the drawer starts to be pulled out at a lower speed than the drawer and the drawer rail. A coupling lever ensures that the intermediate rail is still pushed along even when the drawer rail has already left the differential roller and that this happens synchronously.
