Abstract (en)
[origin: DE19840919A1] The invention relates to control panels that are used to control the movements of machines such as lathes, enabling said machine movements to be controlled in a simple, obvious and reliable manner when control elements are rotationally actuated. The inventive control panel enabling manual control of the moving components of a machine, whereby the movements of said components form a given angle in relation to each other, consists of rotational operating elements, especially control gears, and is characterized in that the axis of rotation of each operating element, especially each control gear, is perpendicular to, i.e. lies at a right angle to, the direction of the movement of the associated component resulting therefrom.
