Abstract (en)

[origin: DE19933156A1] The invention relates to an electric drive system comprising a d.c. motor (2) with a control circuit provided with an electronic commutator (3). The invention is characterized in that it provides for a derivation of the adjustment signal (V<sub>i\_ref</sub>) originating from the induced motor voltage (E<sub>sample</sub>) detected by a measuring device and from a reference value (V<sub>i\_av</sub>) which is used to regulate the speed of the d.c. motor. The invention is further characterized in that the derived adjustment signal (V<sub>i\_ref</sub>) is used to produce a substantially constant torque for said d.c.motor (2) by adjusting the motor currents (i<sub>a</sub>, i<sub>b</sub>, i<sub>c</sub>).
