Abstract (en)

[origin: EP1113113A2] The method involves using a number of individual water retention systems with associated measurement and data communications paths for passing the determined operating data for the relevant water retention system (4,5,8), e.g. a domestic well, to a central station (11) with data reception station(s) (15) and at least one connected evaluation device (16). Independent claims are also included for the following: a controllable arrangement for controlled water delivery into especially a public channel network, especially for implementing the method, and a water retention system, especially a cistern.
