Abstract (en)  
[origin: FR2791238A1] The invention concerns a slat bedspring with wide vertical movement amplitude, capable of matching and maintaining in an ideal position, the anatomical profile of each user during sleep. It consists of an assembly of slats (1), provided with longitudinal slots (2) supported at their two ends by a rod (3), sliding in a bore (10), provided through and through, on the vertical post (9), of the bedspring. Each rod (3) is urged to be supported on a draw spring (12) fixed beneath said vertical post by means of a washer (13) and a screw (14). Thus, each slat (1) will be adjusted in height in use according to the sleeper's anatomical profile, while efficiently maintaining him.
